## Content

- Input and output of `rfquery.py` — group33's implementation of project 1 — on three query strings: **per se**, **brin**, and **jaguar**.
- All results shown are from executions on a Google Compute Engine VM, named `gcvm-1`
- All three runs reached **precision@10** of **1.0** after the first query expansion. The format of the output mimics that of the reference implementation
